## 1.0 Introduction to TOTAL Scorecard

### 1.1 Purpose of TOTAL Scorecard Developer's Guide

The TOTAL Scorecard Developer's Guide provides the necessary information to establish an interface between the FHA's TOTAL Scorecard and an Automated Underwriting System(AUS). This document is primarily aimed at the software development and maintenance staff supporting an AUS. The document contains the following sections:

- Section 1 - Introduction to TOTAL Scorecard includes an overview of TOTAL Scorecard.
- Section 2 - Getting Started describes communication protocols, tips on building your TOTAL Scorecard interface, and security requirements.
- Section 3 - Interface File Descriptions details XML file formats and error handling.
- Appendices – including the Scorecard Data Elements, Error Codes and the DTD.

The purpose of this guide is to provide technical guidance to Automated Underwriting System (AUS) providers who are or desire to be interfaced with FHA's TOTAL Mortgage Scorecard. This guide does not provide or imply credit policy guidance for FHA insuring.

For agency credit policies refer to:

Handbook 4000.1, FHA Single Family Housing Policy Handbook

For agency policies pertaining to the use of FHA's TOTAL Mortgage Scorecard, refer to:

Handbook 4000.1, FHA Single Family Housing Policy Handbook, Section II. A. 4. Underwriting the Borrower Using the TOTAL Mortgage Scorecard (TOTAL)

### 1.2 Overview of TOTAL Scorecard

TOTAL Scorecard is a transaction-based system. The steps below describe the processing of loan information from the lender's AUS, to the TOTAL Scorecard, and back to the lender. These steps must be performed for each transaction processed through the TOTAL Scorecard.

1. Loan information is entered into the lender's AUS.
2. The lender requests an underwriting decision from the AUS.
3. The AUS pulls the borrower's credit and applies eligibility rules.
4. The AUS calls the TOTAL Scorecard
5. The AUS examines the TOTAL Scorecard results along with other criteria to provide an underwriting decision.

NOTES:

## 2.0 Getting Started

This section is designed to assist AUS developers (management and staff) in planning the organization's interface to the TOTAL Scorecard.

The following topics are outlined in this section:

- **Things to Consider** - There are decisions that the AUS developer must take into consideration when developing the TOTAL Scorecard interface.
- **Building the TOTAL Scorecard Interface** - There are steps that the AUS developer must follow with regard to implementation of these requirements, whether it be for initial or subsequent use. Most steps are likely to already be part of your system development process.
- **Security Requirements and Recommendations** - There are general rules and requirements that apply to the AUS developer when interfacing with the TOTAL Scorecard which directly impact system and data-related security.

### 2.1 *Things to Consider*

This section provides some key points for your consideration in the planning and development of the TOTAL Scorecard interface.

#### 2.1.1 Interface Data File Formats

The TOTAL Scorecard uses Extensible Markup Language (XML). XML uses tags that define the data elements. The TOTAL Scorecard WSDL and Schemas are included in Appendix D in this document. The TOTAL Scorecard call is made using Simple Object Access Protocol (SOAP) Web Services. For further information regarding interface file descriptions, refer to section 3 of this manual. The SOAP call will be secured via SSL using HTTPS.

#### 2.1.2 Communications Protocol

The communications protocol for TOTAL Scorecard is SOAP. The SOAP call to the TOTAL Scorecard will be secured using HTTPS.

The HTTPS communications protocol provides two layers of data protection.

- The HTTPS communications protocol requires that a certificate reside on the server. This certificate must be issued by a trusted certificate authority. This ensures that the user is communicating with the TOTAL Scorecard and not some third party trying to spoof the TOTAL Scorecard's IP address.
- The HTTPS protocol encapsulates standard Hyper Text Transfer Protocol (HTTP) within the Secure Socket Layer (SSL). SSL is a universally accepted mechanism for securing data in transit across the Internet. SSL provides a very secure data encryption mechanism.

### 2.2 *Building the TOTAL Scorecard Interface*

#### 2.2.1 Data Mapping

The first aspect in developing of the TOTAL Scorecard interface is reviewing the data and formats required by the TOTAL Scorecard. The AUS developer must map each of the TOTAL Scorecard XML data elements to the corresponding data element(s) in the AUS. A field-by-field matrix is the suggested method for accomplishing this data mapping.

Through the data mapping process, you are able to identify:

- **Data elements that are currently available within your system** - This set of data elements should not require a significant effort in the process of developing the interface.
- **Data elements that are available but values must be re-mapped or calculated** - These data elements require re-mapping of the values within your system to the values that TOTAL Scorecard requires.
- **Data elements that are unavailable in your system** - The AUS must be modified to capture these additional data elements, utilizing new or existing screens.

### ***2.3 Security Requirements and Recommendations***

TOTAL Scorecard's security requirements and recommendations adhere to the standards that have been established by the Automated Data Processing Security Office at HUD. All TOTAL Scorecard transactions are required to have the following:

- **User ID** – up to ten alphanumeric characters; and
- **Password** – up to ten alphanumeric characters.

User IDs and passwords are sent as part of the SOAP Header. User IDs will be issued to partners as they are ready to begin developing their calls to the TOTAL Scorecard.

### 3.0 Interface File Descriptions

The AUS interfacing with the TOTAL Scorecard must be able to build TOTAL Scorecard standard XML data for a given Scorecard request. This XML will be transmitted via a SOAP request. This section details the format of both the SOAP Request and Response Objects.

The SOAP Request and Response objects are defined by the XML Schema and Web Service Definition Language (WSDL) shown in Appendix D.

Please note: All data must be properly represented in XML. There are five entity reference substitutions which are shown below. If any data is submitted that contains any of these characters, the proper entity reference should be included in the XML or that field must be identified as unparsed character data.

Entity	Character	Entity Reference
Ampersand	&	&amp;
Greater Than Sign	>	&gt;
Less Than Sign	<	&lt;
Quote	“	&quot;
Apostrophe	‘	&apos;

For example, if a data field contained the following value “A & B Construction” the data would have to be represented as such:

```
<mytag>A &amp; B Construction</mytag>
```

Or

```
<mytag> <![CDATA[A & B Construction]] </mytag>
```

Many credit reports contain these characters. It is a good practice to automatically identify all credit reports as unparsed character data.
