Federal Partnership Saves Energy for 337,000 U.S. Households

According to the first annual review of the Partnerships for Home Energy Efficiency (PHEE), released in October, PHAs invested close to $350 million in energy performance contracts in 2006, with an estimated savings of $37 million. The number of PHAs entering into energy performance contracts has increased by an average of 24 percent since 2000.

Homes account for about 21 percent of U.S. energy use and cause about 17 percent of total U.S. greenhouse gas emissions. The PHEE, a joint effort of the U.S. Department of Energy (DOE), the U. S. Environmental Protection Agency (EPA), and the U.S. Department of Housing and Urban Development (HUD), aims to reduce the energy consumption of the average home 10 percent by 2015. Meeting this goal would save $20 billion a year in utility costs, increase the affordability and comfort of homes, reduce demand for natural gas by nearly 1 percent of total U.S. energy demand, and avoid greenhouse gas emissions equivalent to the emissions from over 25 million vehicles.

The combined efforts of the three agencies have improved the energy efficiency of more than 337,000 homes and apartments across the United States over the past year alone.

Integrated Pest Management Knocks ‘Em Dead

Integrated Pest Management (IPM) combines several methods of pest management to effectively eliminate pests in safer and more cost-effective ways than traditional pesticide treatments. IPM methods include improved sanitation, reduced-risk bait formulations, traps, and biological control agents. For IPM to work, residents, maintenance staff, and licensed contractors must cooperate to reduce the threat of pest infestation and, if present, remedy it quickly.

PHAs from Chicago to Cuyahoga have implemented IPM with great success. Explore these resources to learn more:
Houses That Work

December 12, 2006

Lansing, MI

The Energy and Environmental Building Association (EEBA) is sponsoring this session to provide energy managers and resource-conscious builders with strategies that reduce utility bills, maintenance and resident complaints. National building science experts will present practical business strategies and product demonstrations. Visit EEBA for information.

SUCCESS STORIES

Eureka Audit Reveals Opportunities for Energy Improvements

According to their Executive Director, the City of Eureka HA has already seen individual unit savings of $20-$40 per year and many efficiency improvements have not yet been implemented.

Photo: City of Eureka Housing Authority

In August, the City of Eureka Housing Authority completed a comprehensive energy audit. The Auditors determined that lighting and laundry accounted for the majority of annual electricity consumption, while water heating was the biggest consumer of natural gas.

Individual, natural gas-fired, 30-gallon hot water tanks were present in each of the units. The water heaters were typically set at the highest temperature setting, had no insulating wrap on the tank or pipes, and had no heat traps. Less than 10 percent of lighting fixtures had compact fluorescent bulbs (CFLs), although linear fluorescent fixtures were installed in the kitchens of newer units.

Auditors identified several simple energy- and water-efficient opportunities based on their observations. The following recommendations are all projected to have a payback period of less than 2 years:

- Adjust water heating settings to 120 degrees
- Install water tank wraps and pipe insulation
- Install heat traps on hot water tanks
- Install CFLs in existing fixtures
- Install low-flow shower heads
- Educate tenants on energy and water conservation

For more information about this project, contact the City of Eureka Housing Authority Executive Director Bob Morelli at (707) 443-4583.

**ENERGY WATCH**

**Energy-Efficiency: Why You Can Get Some of It for Free**

Rebates for energy-efficient measures were all the rage in the ’80s and early ’90s, but dropped by about 50 percent in the mid-1990s during a wave of utility deregulation. Without Federally mandated programs, privately owned utilities suddenly had little reason to encourage consumers to buy less energy. But rising power demands, high energy costs, and state-mandated energy-efficiency planning are bringing rebates back.

In some regions, power demand is approaching the limit of supply utilities can deliver. Over the last few years, funding for rebates has almost doubled as privately owned utilities try to avoid building more power plants. In addition to Federal tax incentives and utility-sponsored rebates, some state energy agencies now offer rebates directly to consumers as well.

To find local funding options, start with your utility account representative. Even if the utility isn’t offering rebates, it can direct you to useful resources. Also consult your public utility commission, state energy agency, the Database of State Incentives for Renewables and Efficiency, the American Council for an Energy-Efficient Economy and the Partnership for Advancing Technology in Housing.
